# Constructive heuristics - Vertex order

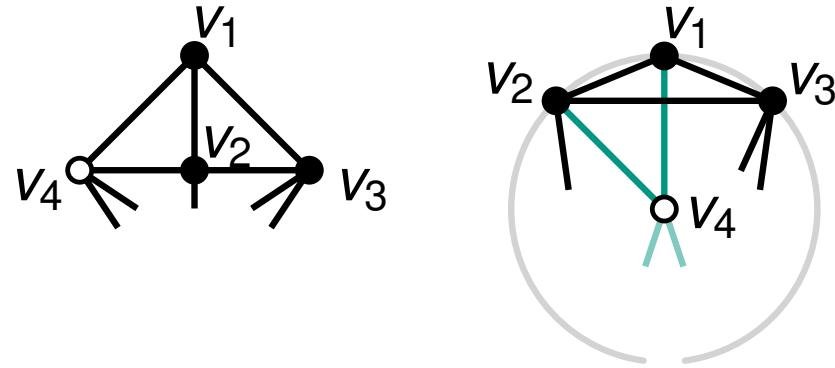

- search based:
  - rDFS · random DFS [He, Sykora '04]
  - smlDgrDFS · smallest degree DFS [Bansal et al. '08]
  - treeBFS · BFS tree based

# Constructive heuristics - Vertex order

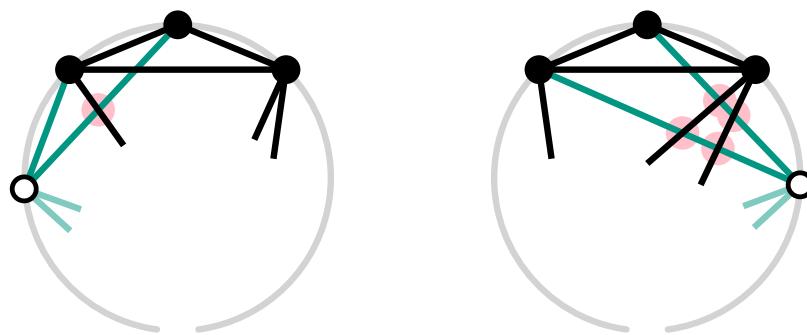

- search based:
  - rDFS · random DFS [He, Sykora '04]
  - smlDgrDFS · smallest degree DFS [Bansal et al. '08]
  - treeBFS · BFS tree based
- connectivity based:
  - conCro [Baur, Brandes '08]
  - conGreedy

  - ceilFloor [Kapoor et al. '02]
  - circ [Satsangi et al. '13]
- earDecomp · ear decomposition based
- slope [He et al. '05]

# Constructive heuristics - VO & PA combined

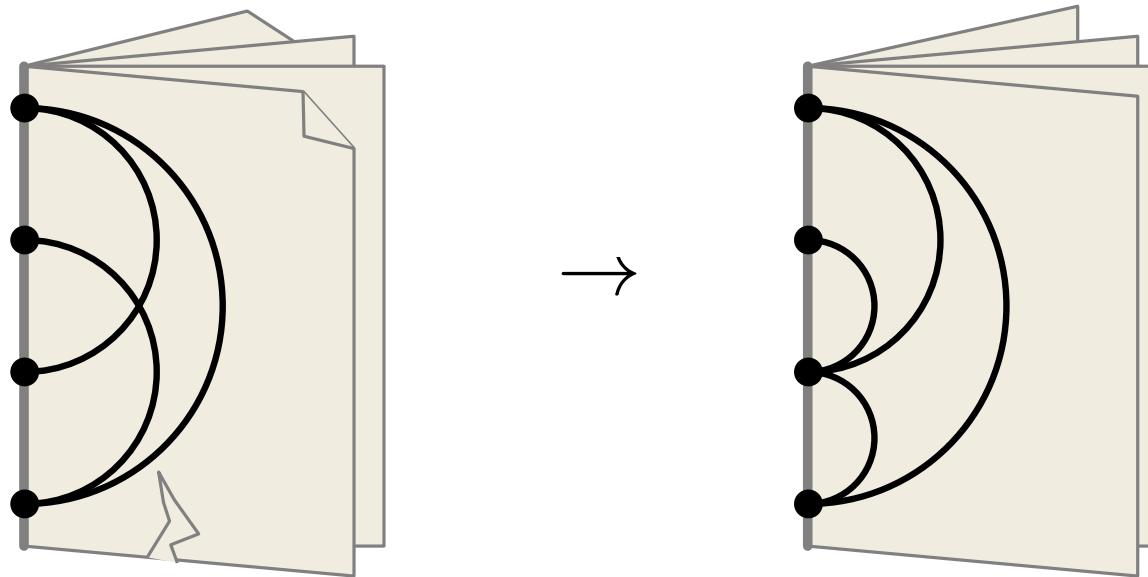

- first VO heuristic, then PA heuristic
- VO and PA simultaneously
  - conGreedy+

# Local search heuristics

# Local search heuristics

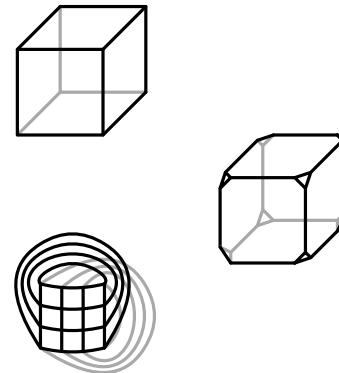

- greedyAlt · greedily optimise VO and PA alternatingly
- greedy+ · greedily optimise VO and PA simultaneously
- simAnn · simulated annealing approach [Cibulka '15]

# Benchmark graphs

# Benchmark graphs

## Homogenous graphs

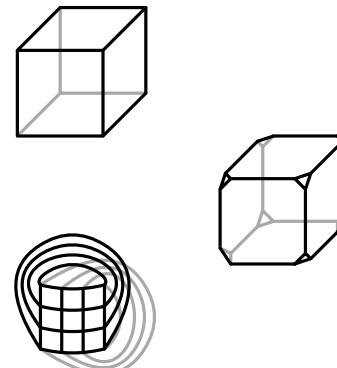

- Hypercube  $\cdot Q_d$
- Cube-connected cycles  $\cdot CCC_d$
- Toroidal graphs  $\cdot C_i \times C_j$
- 3-toroidal graphs  $\cdot C_i \times C_j \times C_l$

# Benchmark graphs

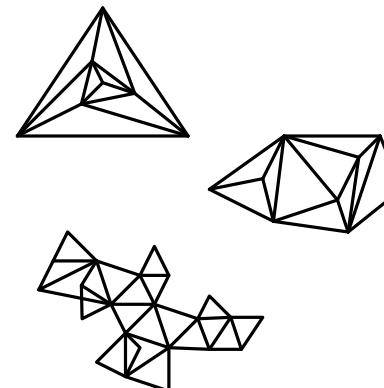

## Homogenous graphs

- Hypercube  $\cdot Q_d$
- Cube-connected cycles  $\cdot CCC_d$
- Toroidal graphs  $\cdot C_i \times C_j$
- 3-toroidal graphs  $\cdot C_i \times C_j \times C_l$

## Structured graphs

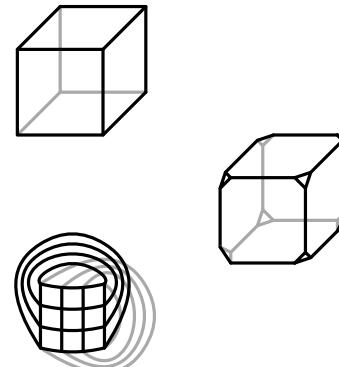

- Topological planar and 1-planar
- Geometric  $k$ -planar ( $k = 0, 1, 2, 3, 4$ )
- $k$ -trees ( $k = 3, \dots, 10$ )

# Benchmark graphs

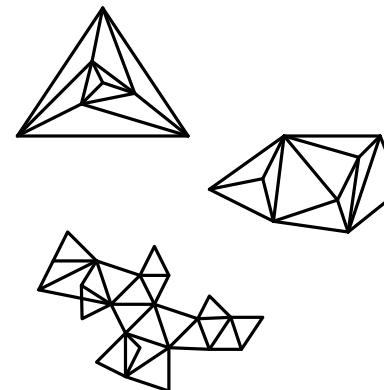

## Homogenous graphs

- Hypercube  $\cdot Q_d$
- Cube-connected cycles  $\cdot CCC_d$
- Toroidal graphs  $\cdot C_i \times C_j$
- 3-toroidal graphs  $\cdot C_i \times C_j \times C_l$

## Structured graphs

- Topological planar and 1-planar
- Geometric  $k$ -planar ( $k = 0, 1, 2, 3, 4$ )
- $k$ -trees ( $k = 3, \dots, 10$ )

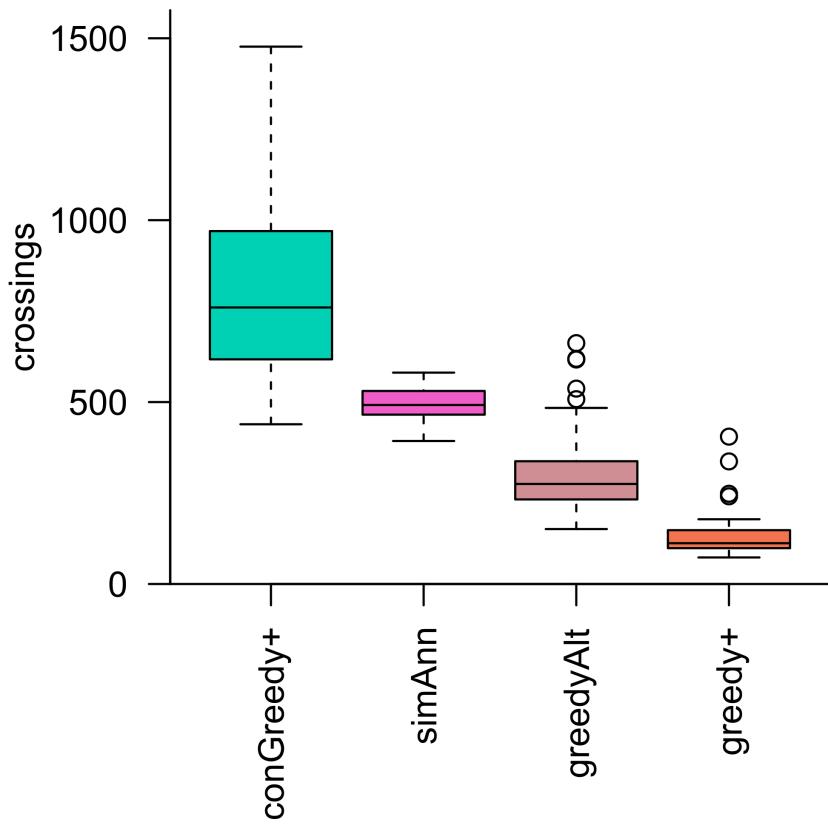

## Random graphs

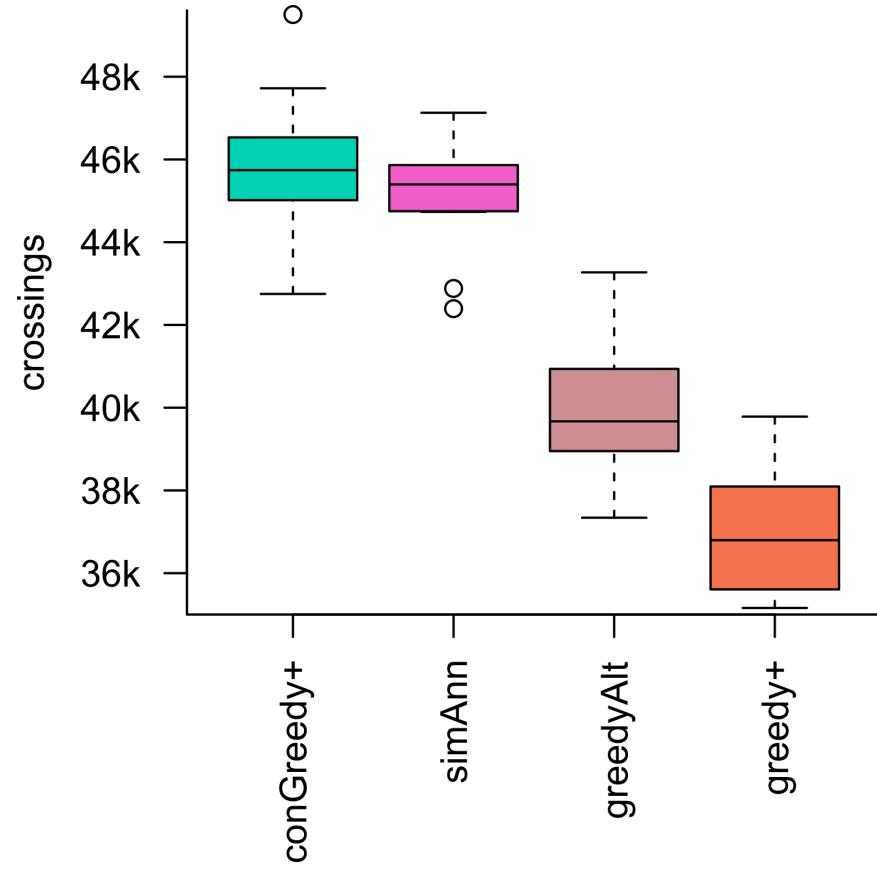

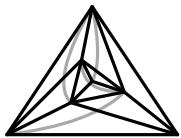

- Linear density ( $\approx a \cdot n$  edges)
- Quadratic density (edge probability  $p$ )

# Evaluation

# Local search heuristics

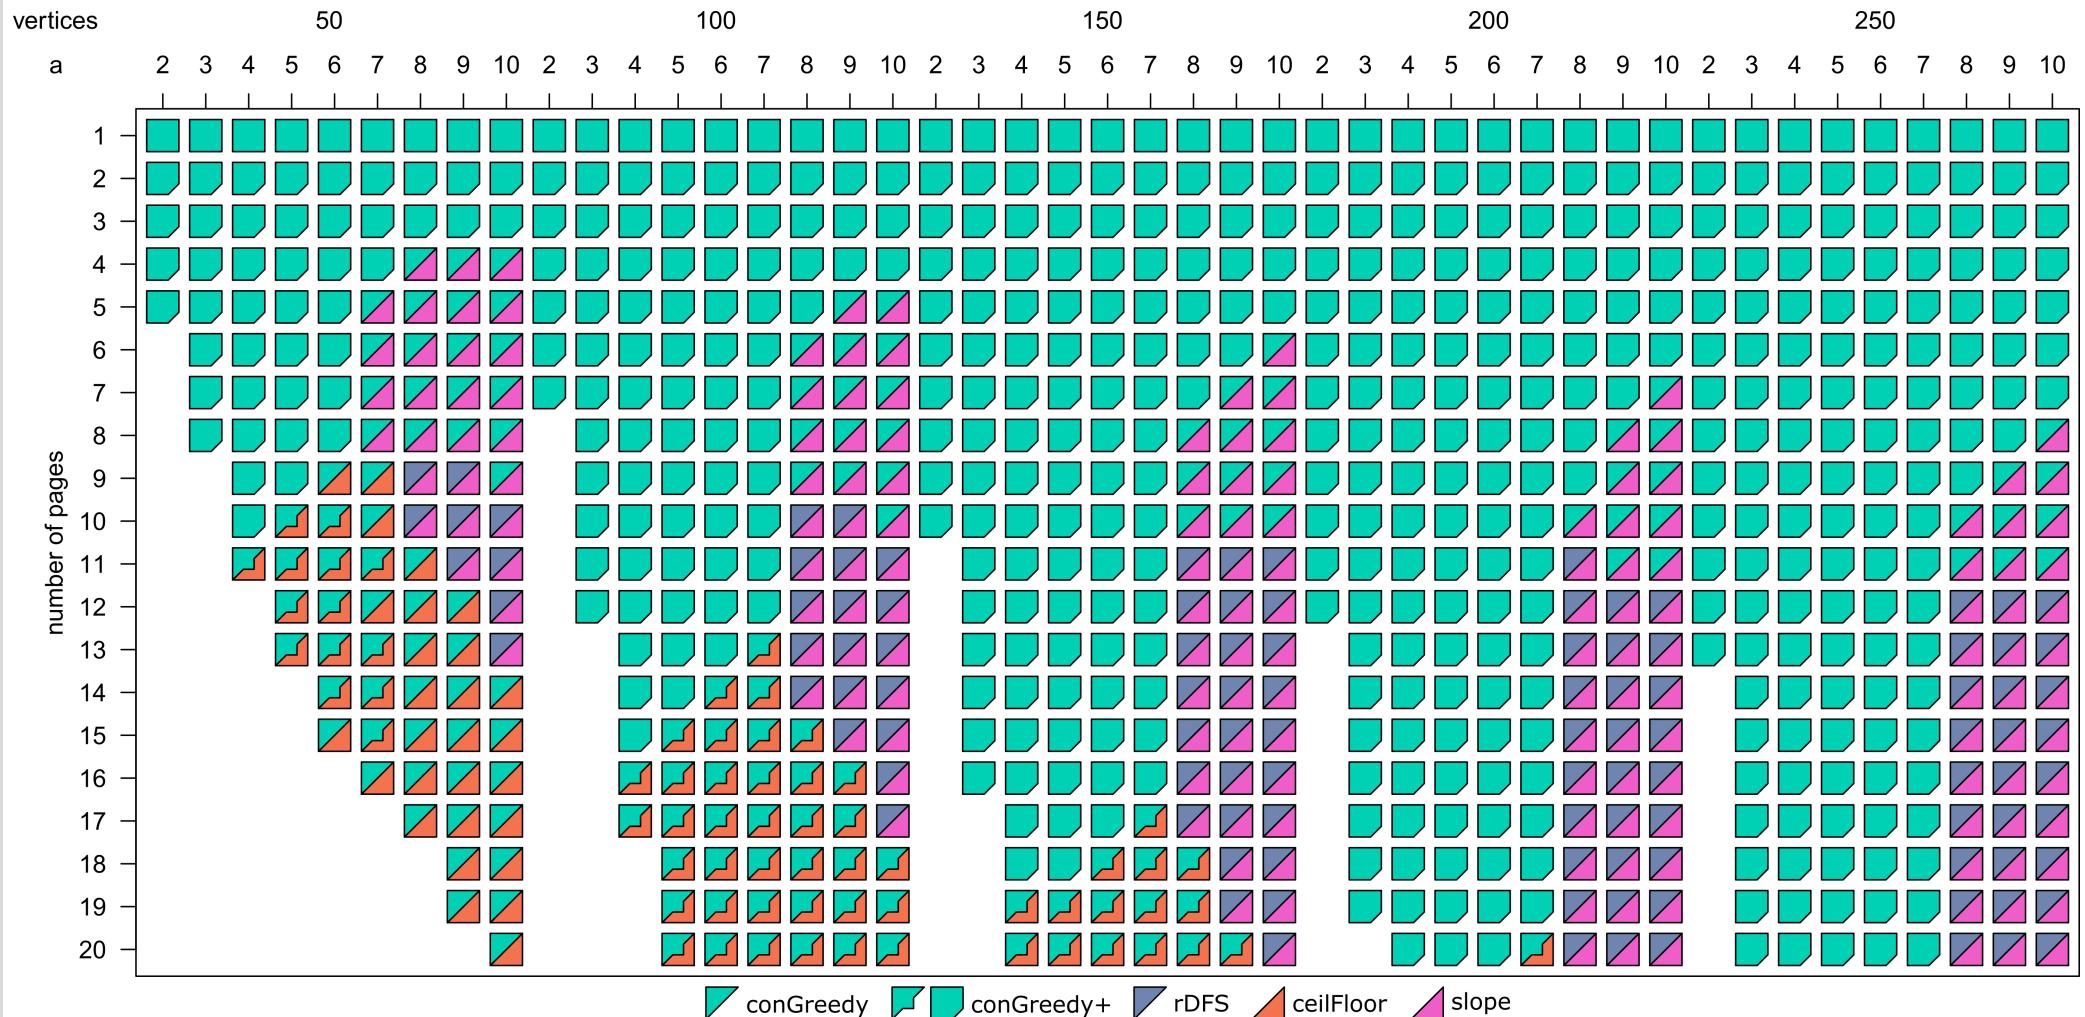

- Topological 1-planar,  
 $n = 250$ , 3 pages,

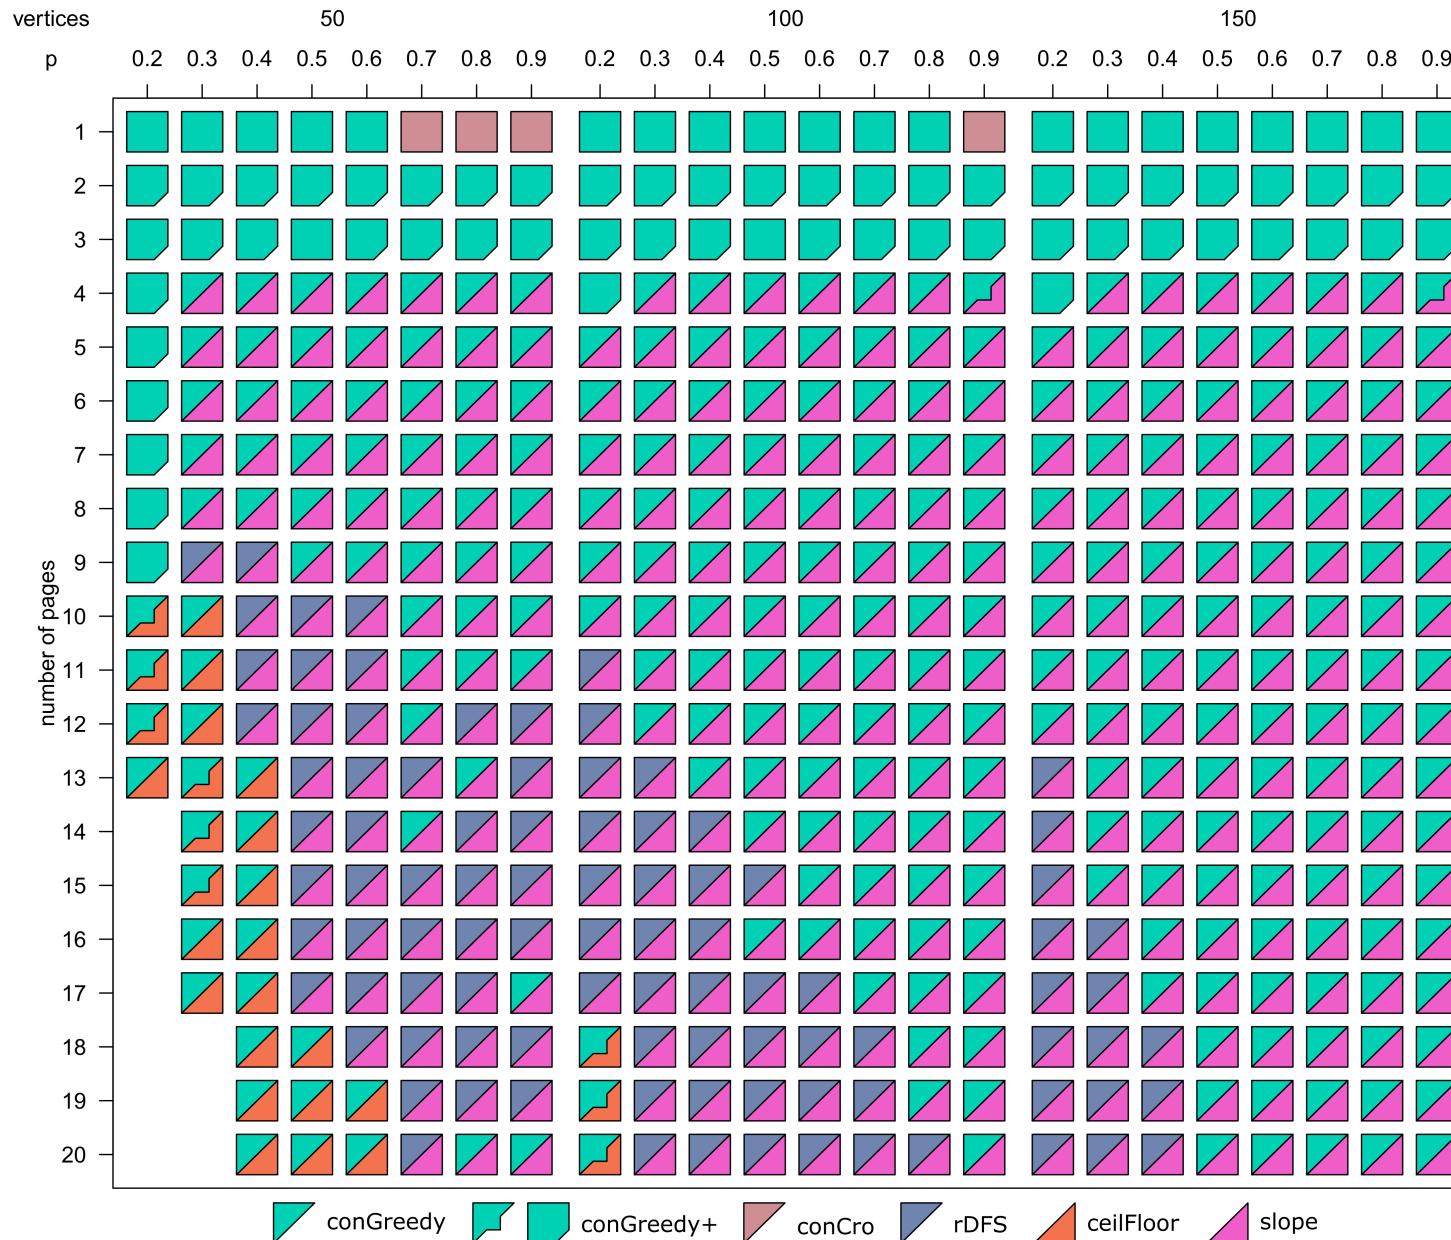

- Random (edge probability 50%),  
 $n = 100$ , 6 pages,

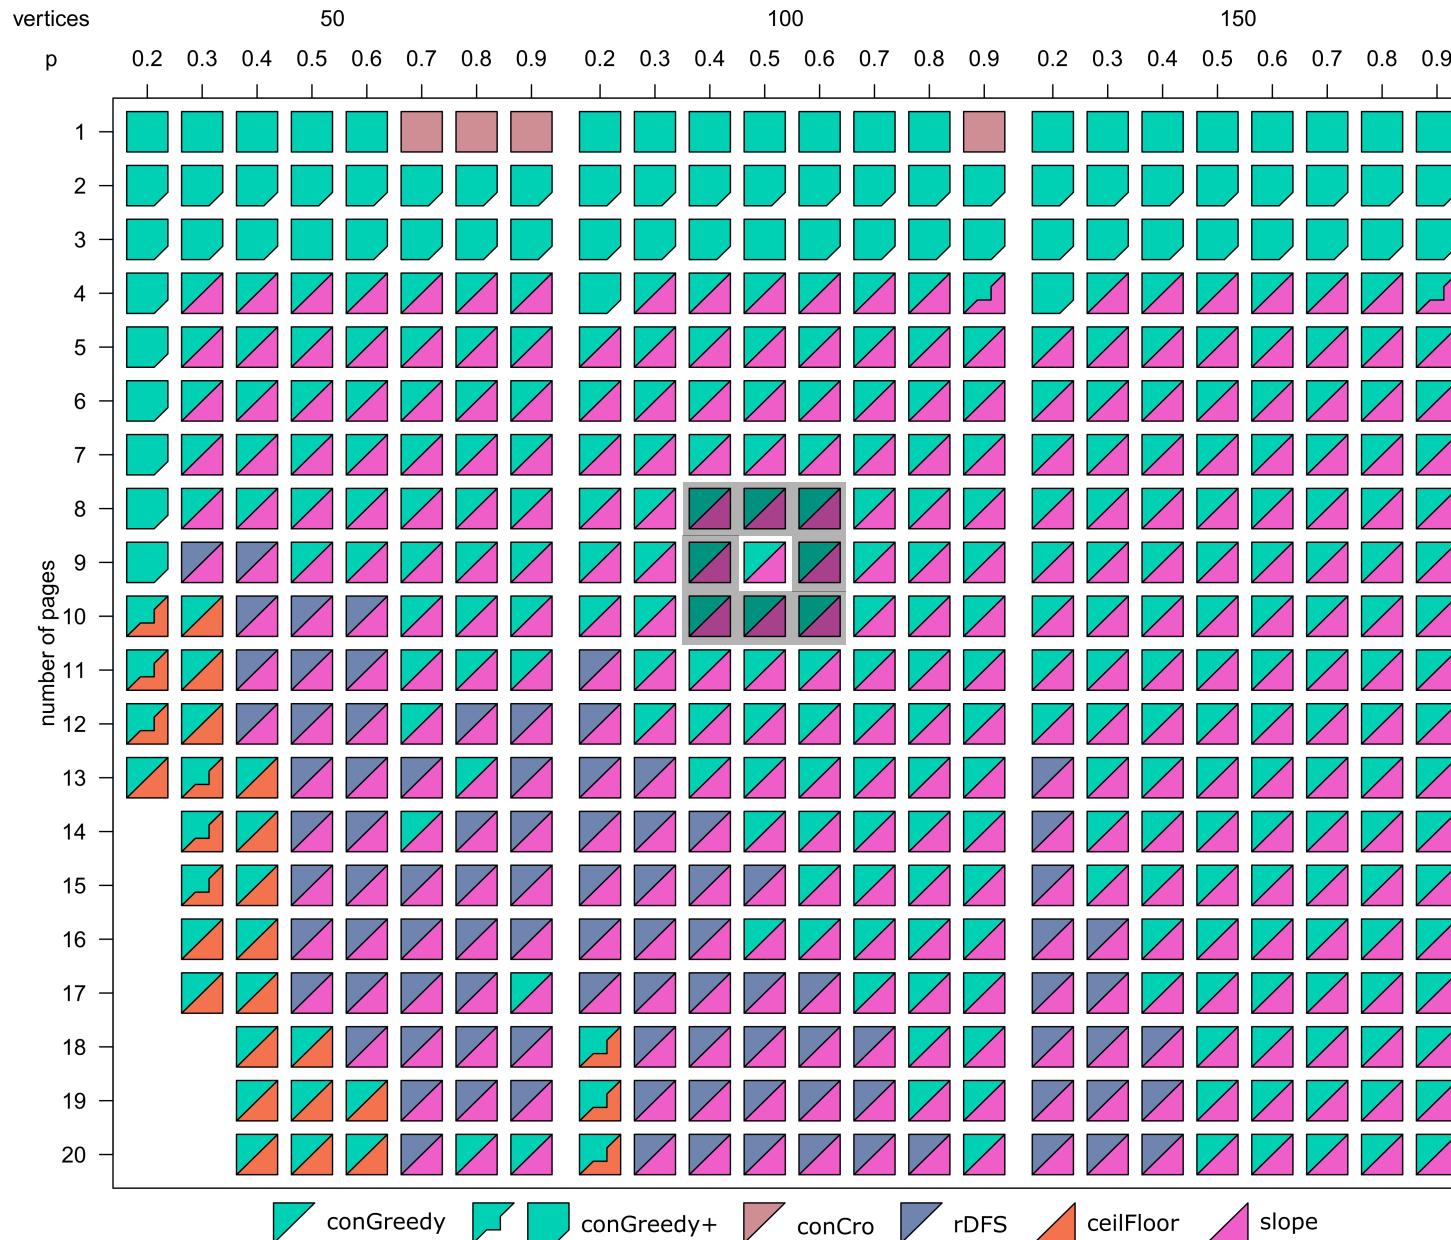

# Random graphs - linear # of edges

# Random graphs - edge probability $p$

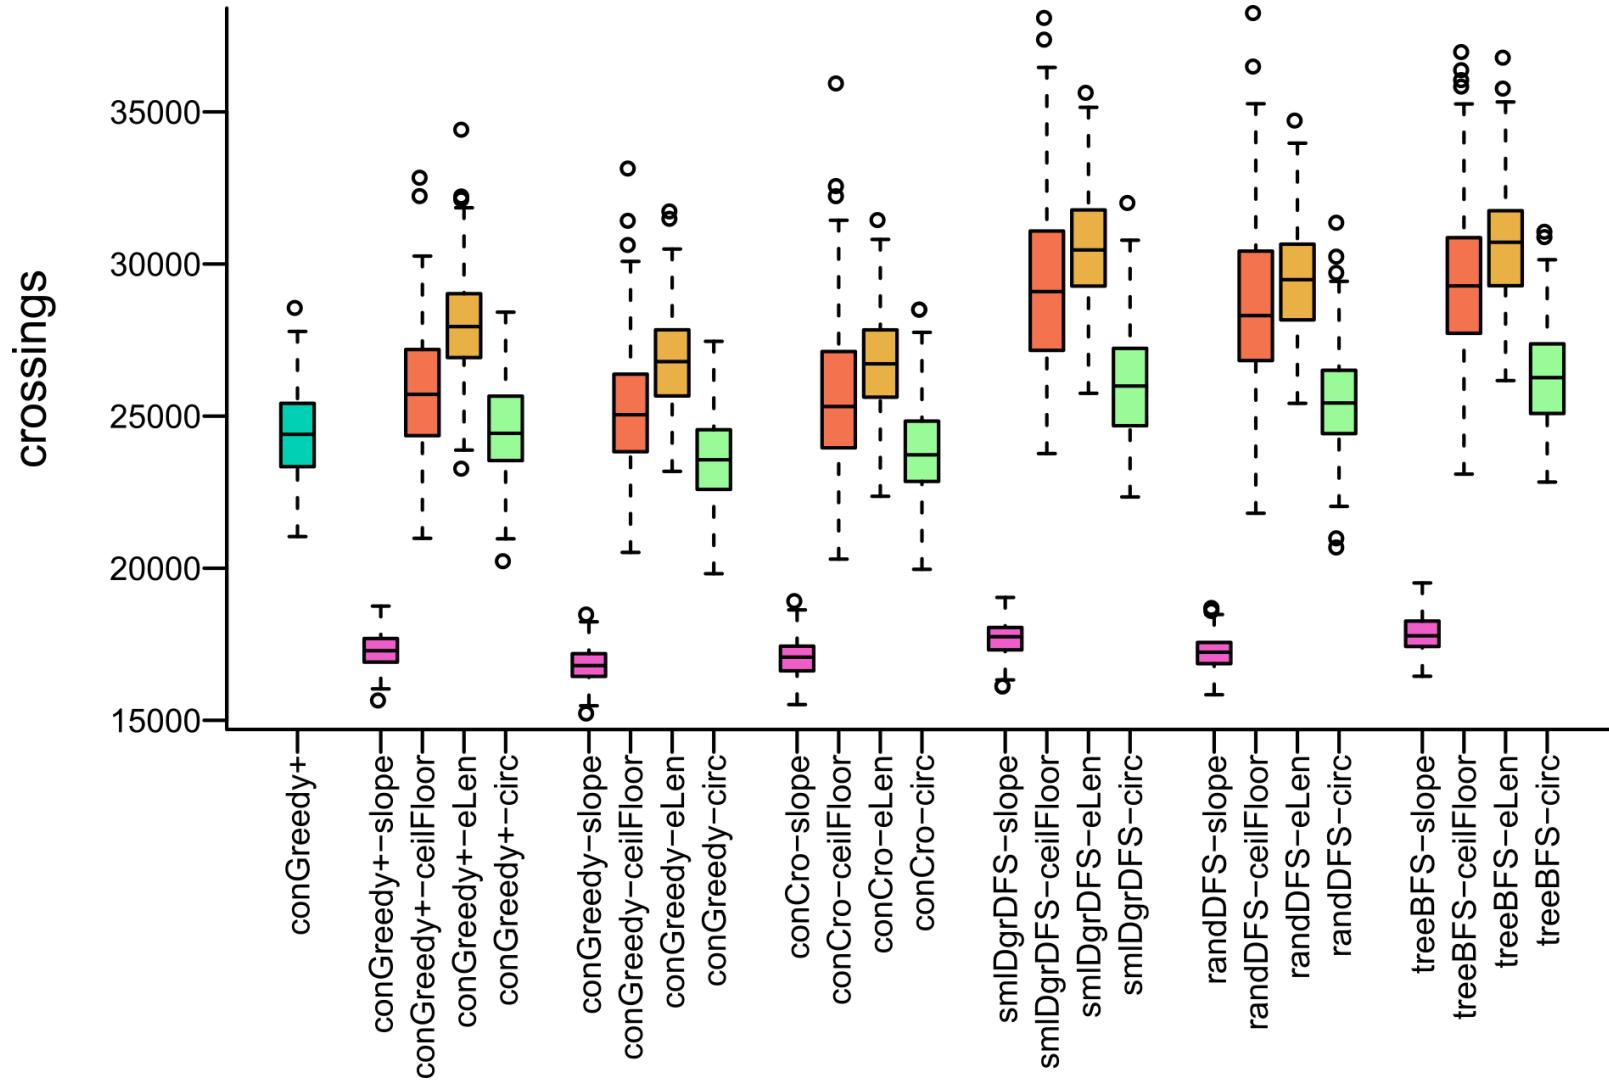

# Random graphs - edge probability $p$

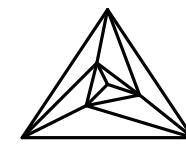

# Random graphs - edge probability $p$

- Edge probability  $p = 0.5$ ,  $n = 100$ , 9 pages

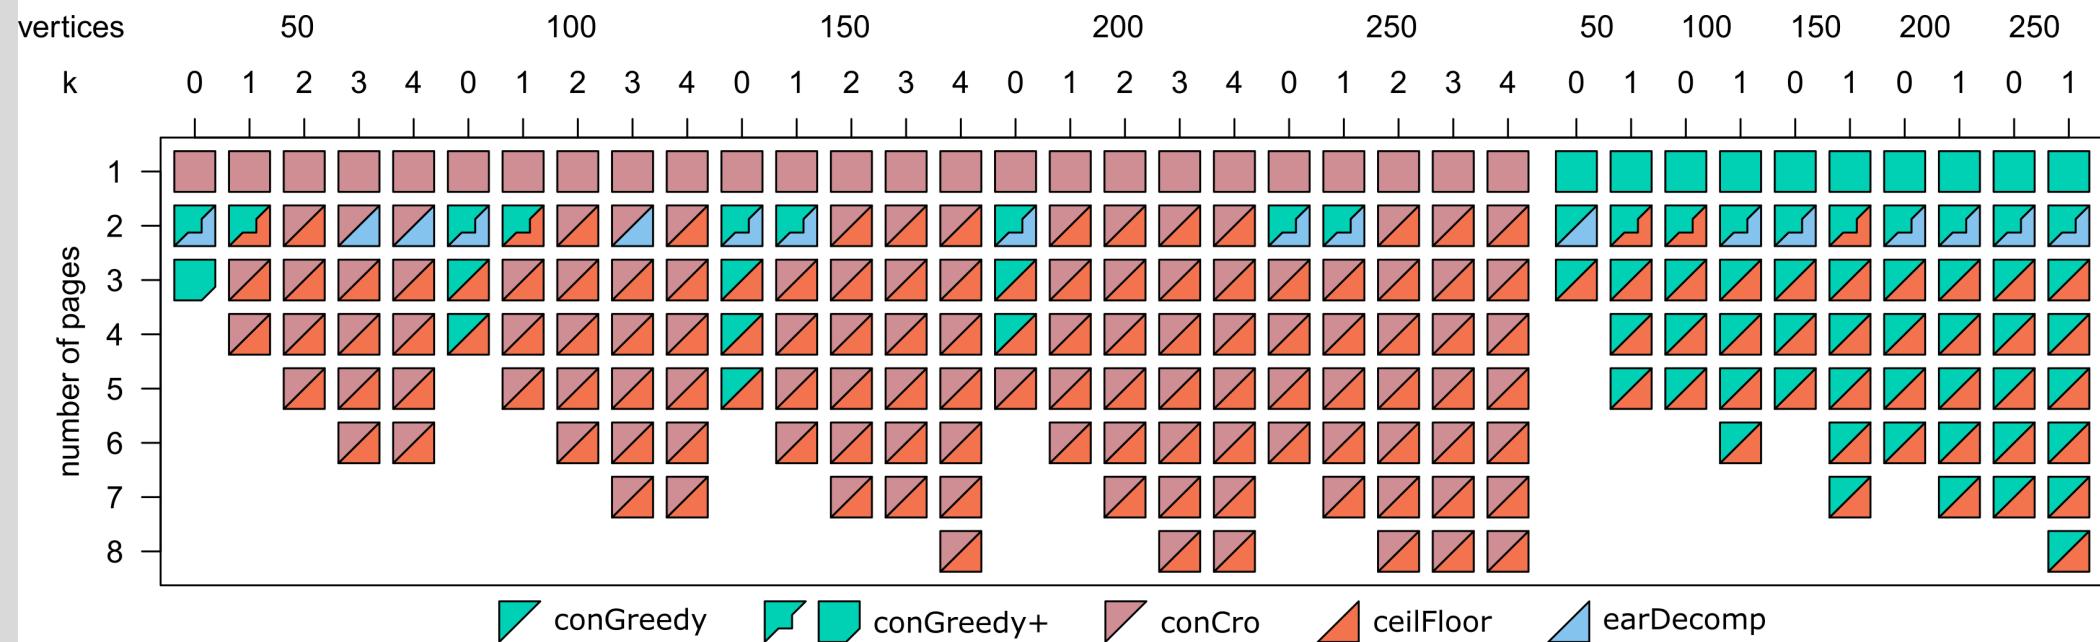

# Structured graphs - *k*-planar

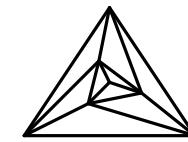

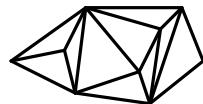

■ Geometric *k*-planar

■ Topological 0/1-planar

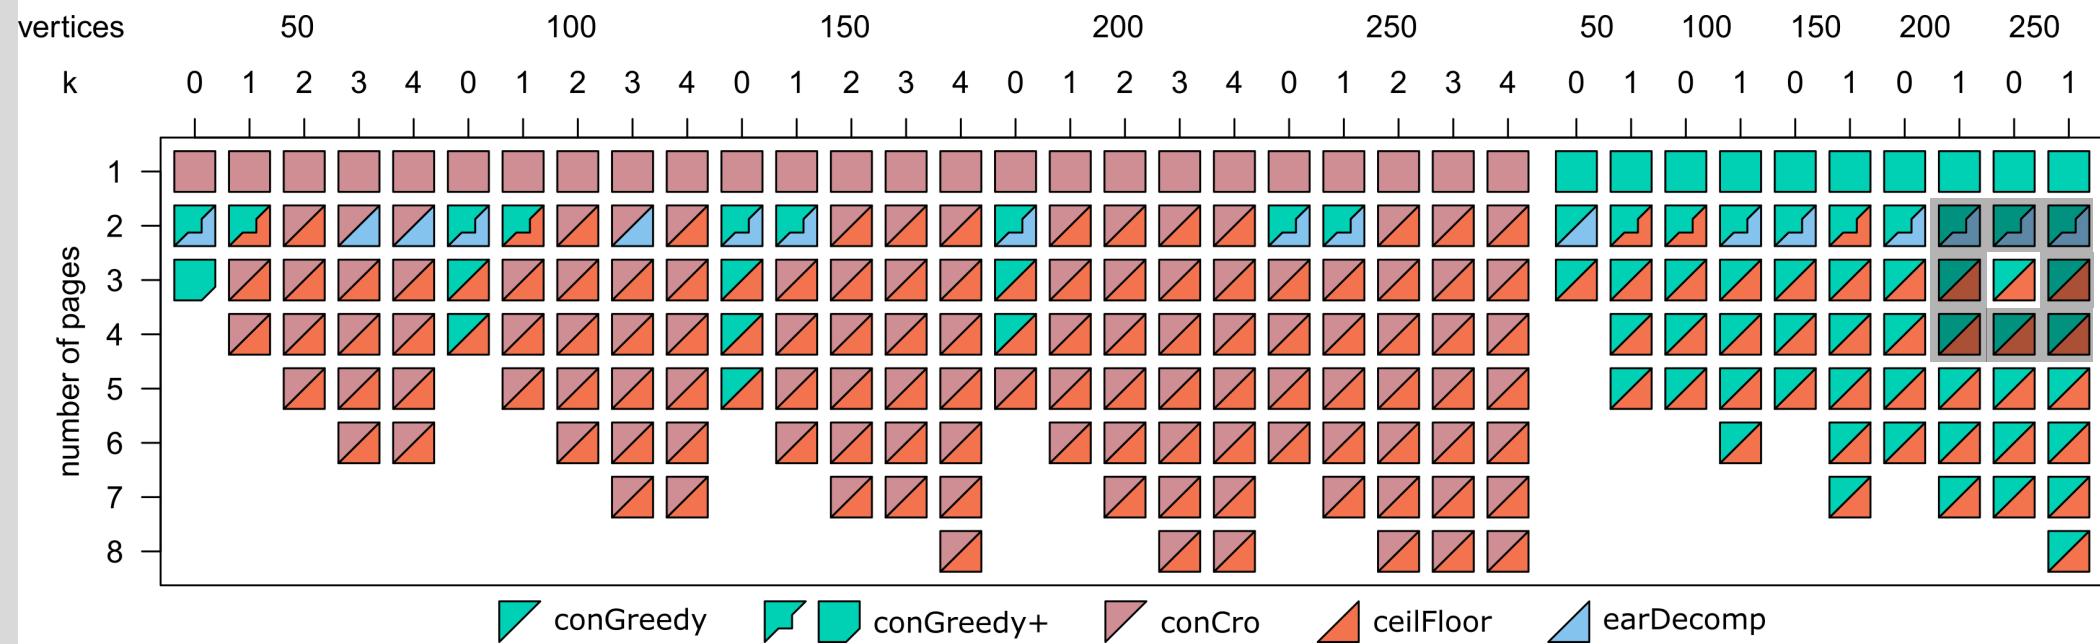

# Structured graphs - *k*-planar

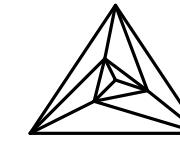

■ Geometric *k*-planar

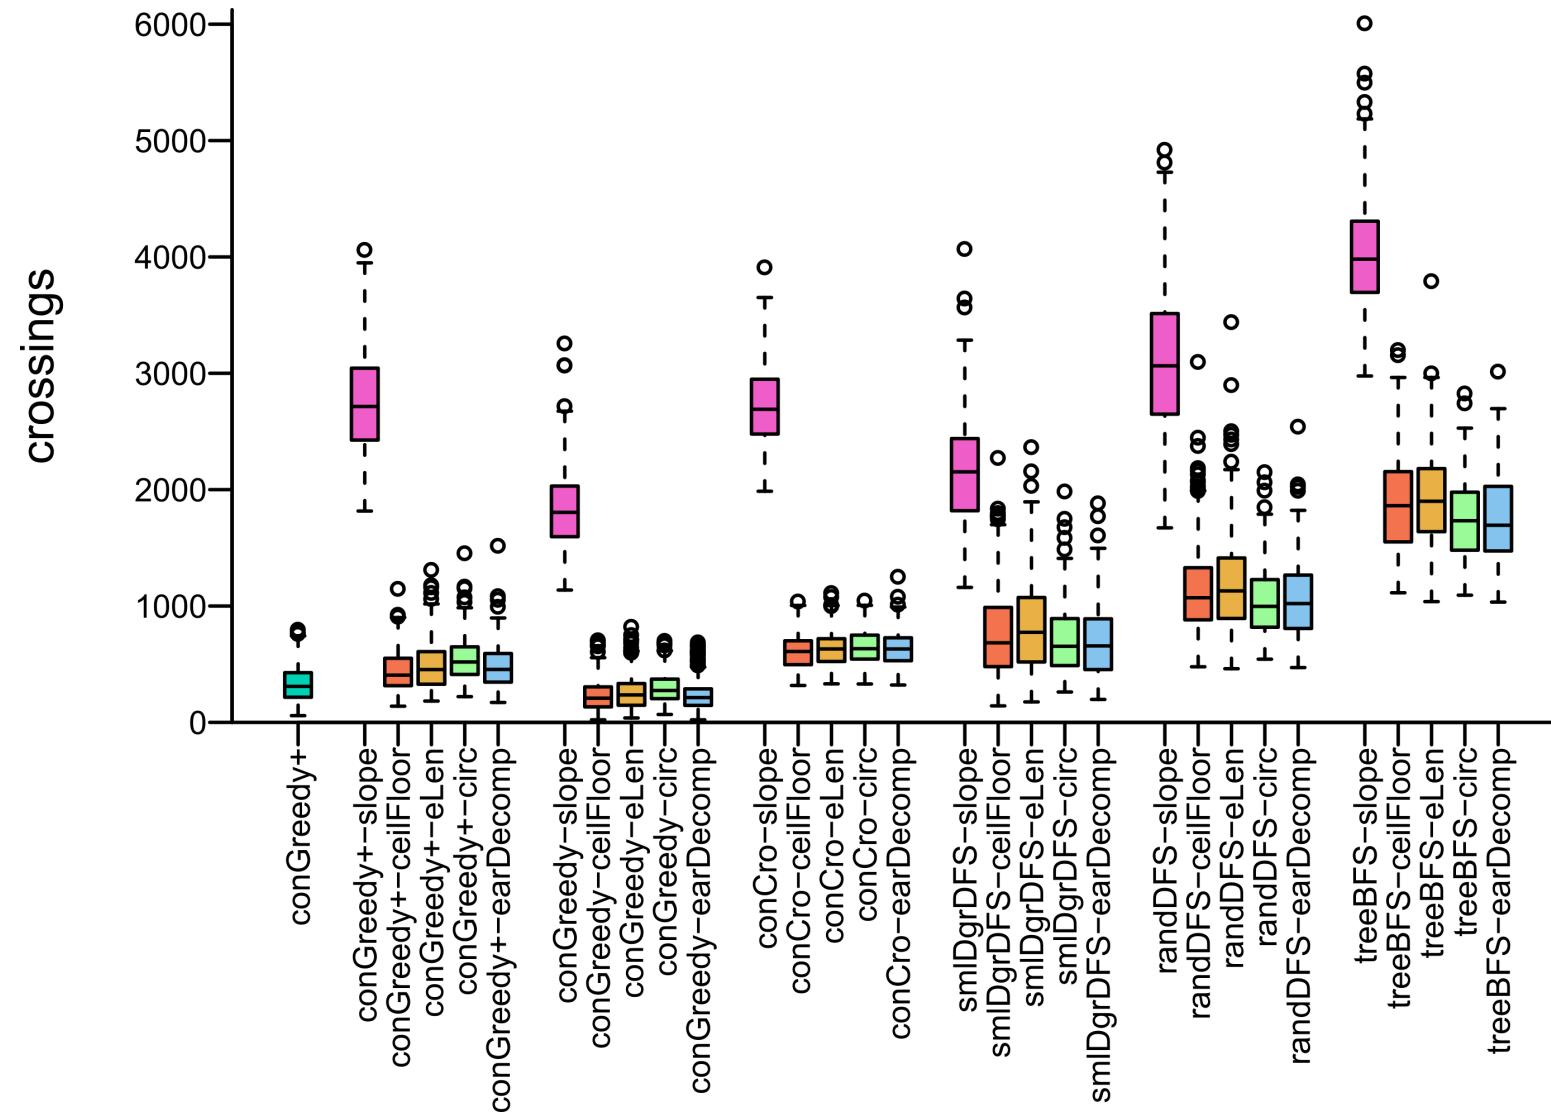

■ Topological 0/1-planar

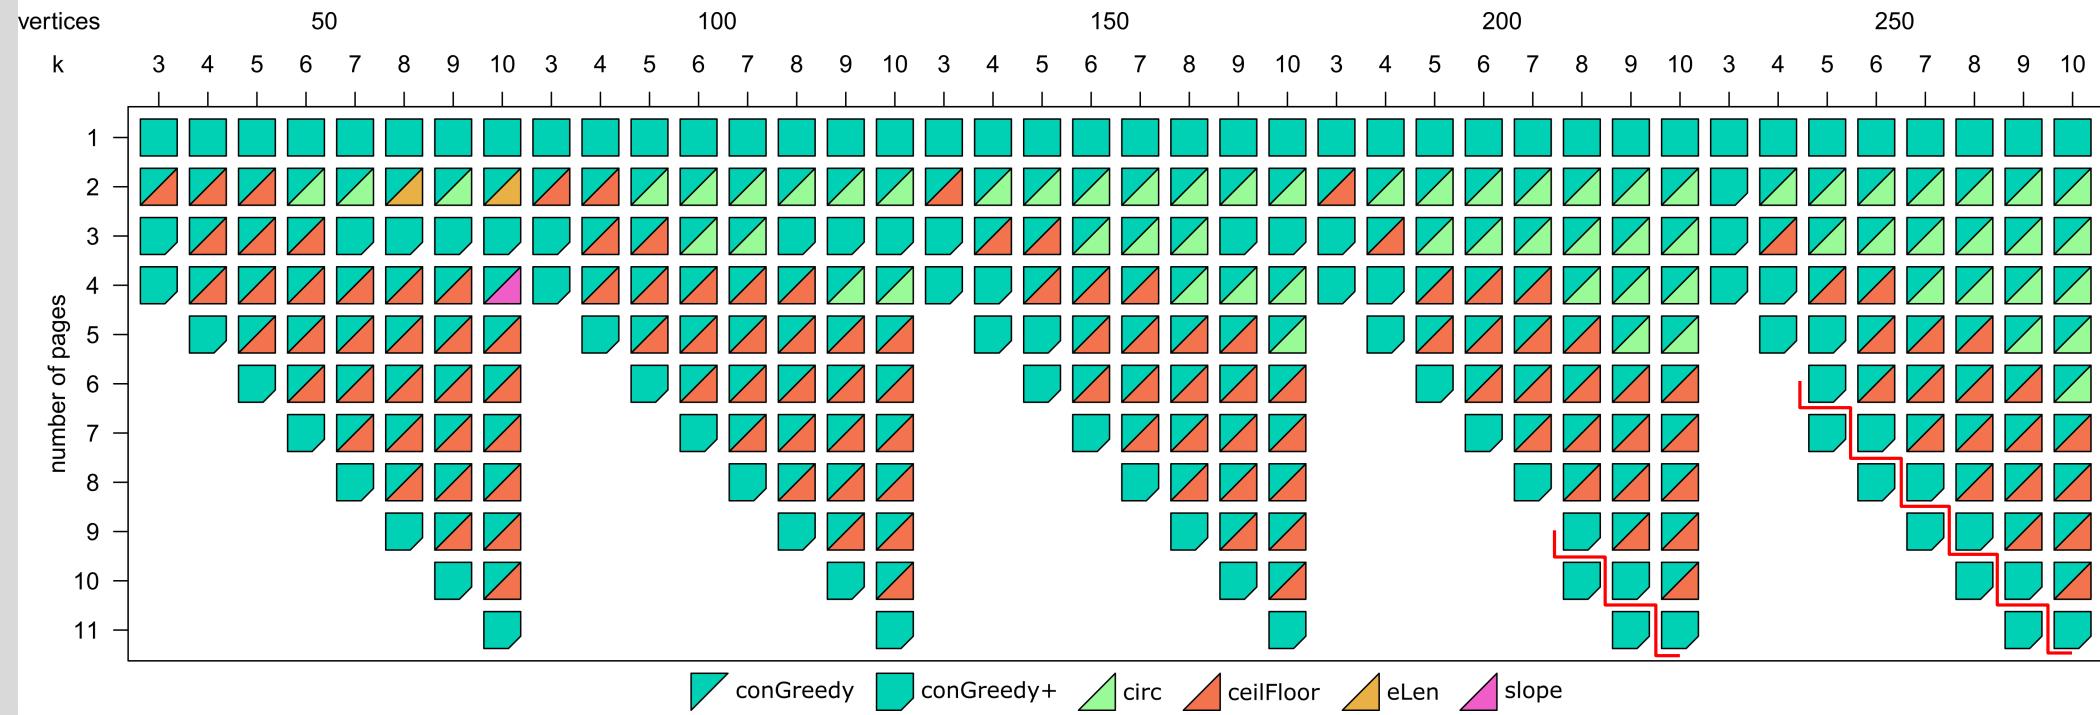

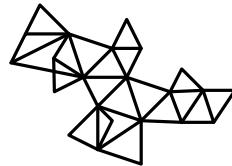

# Structured graphs - Topological planar

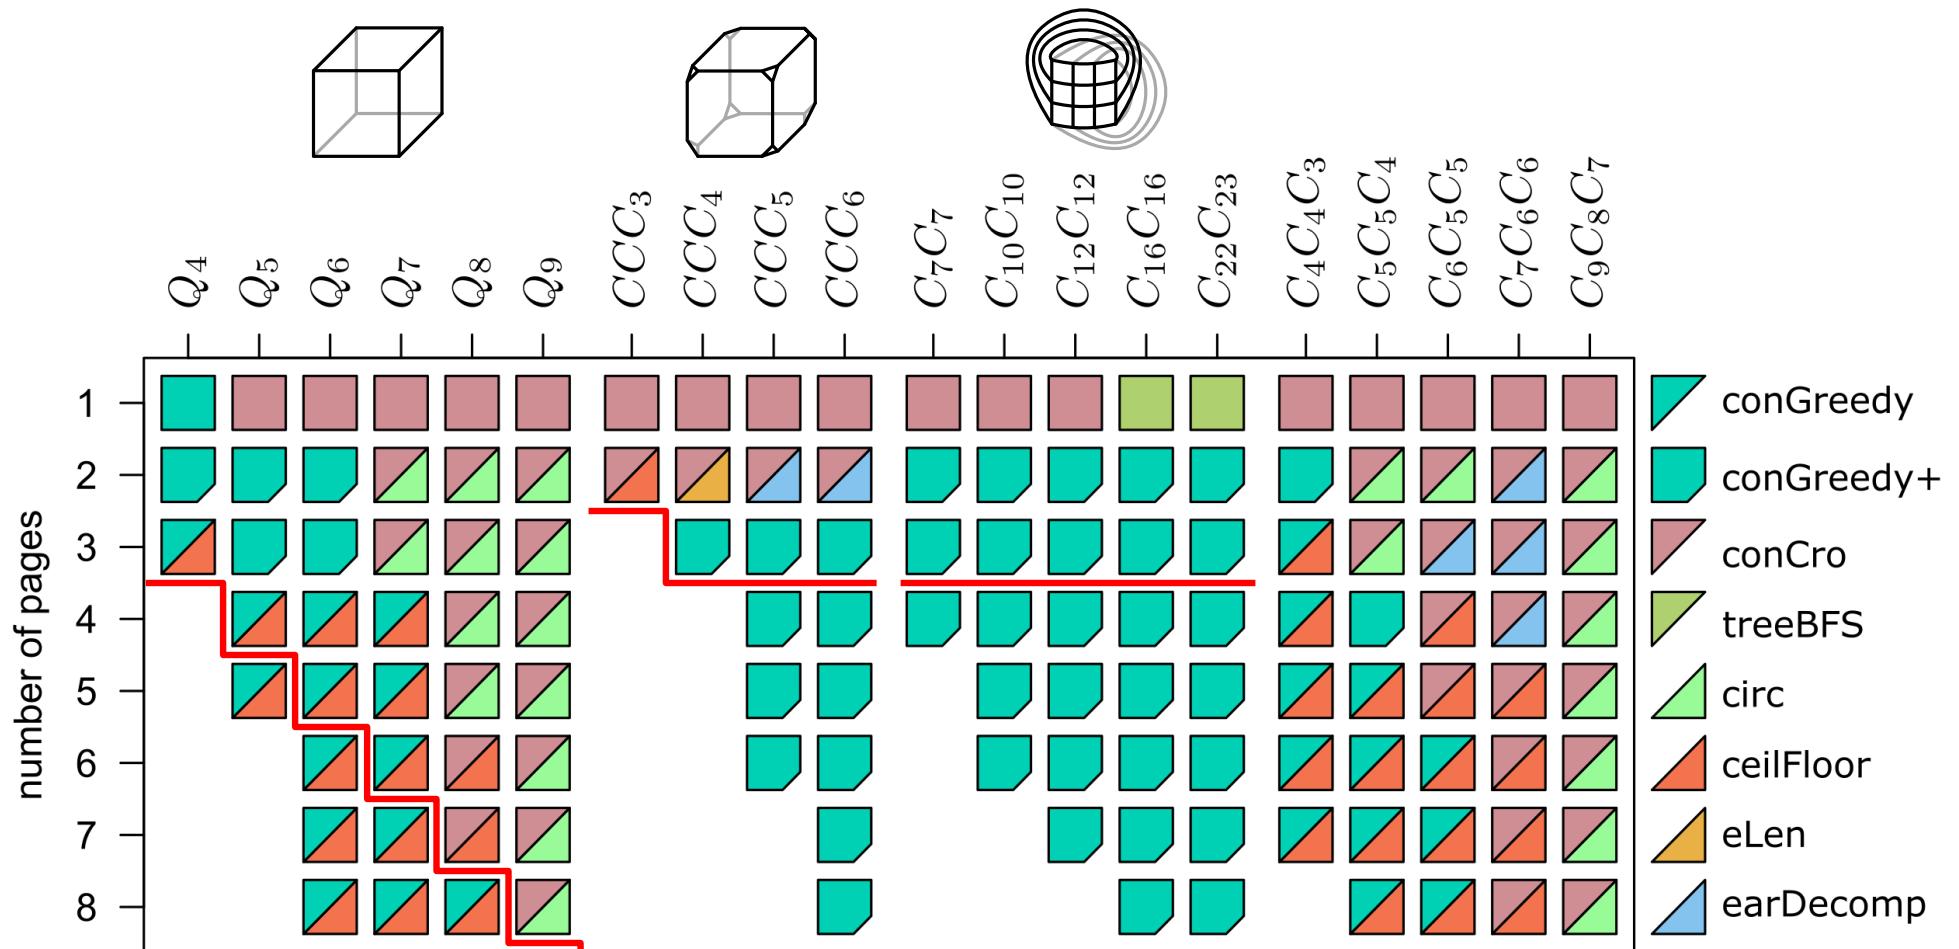

■  $n = 250, 3$  pages

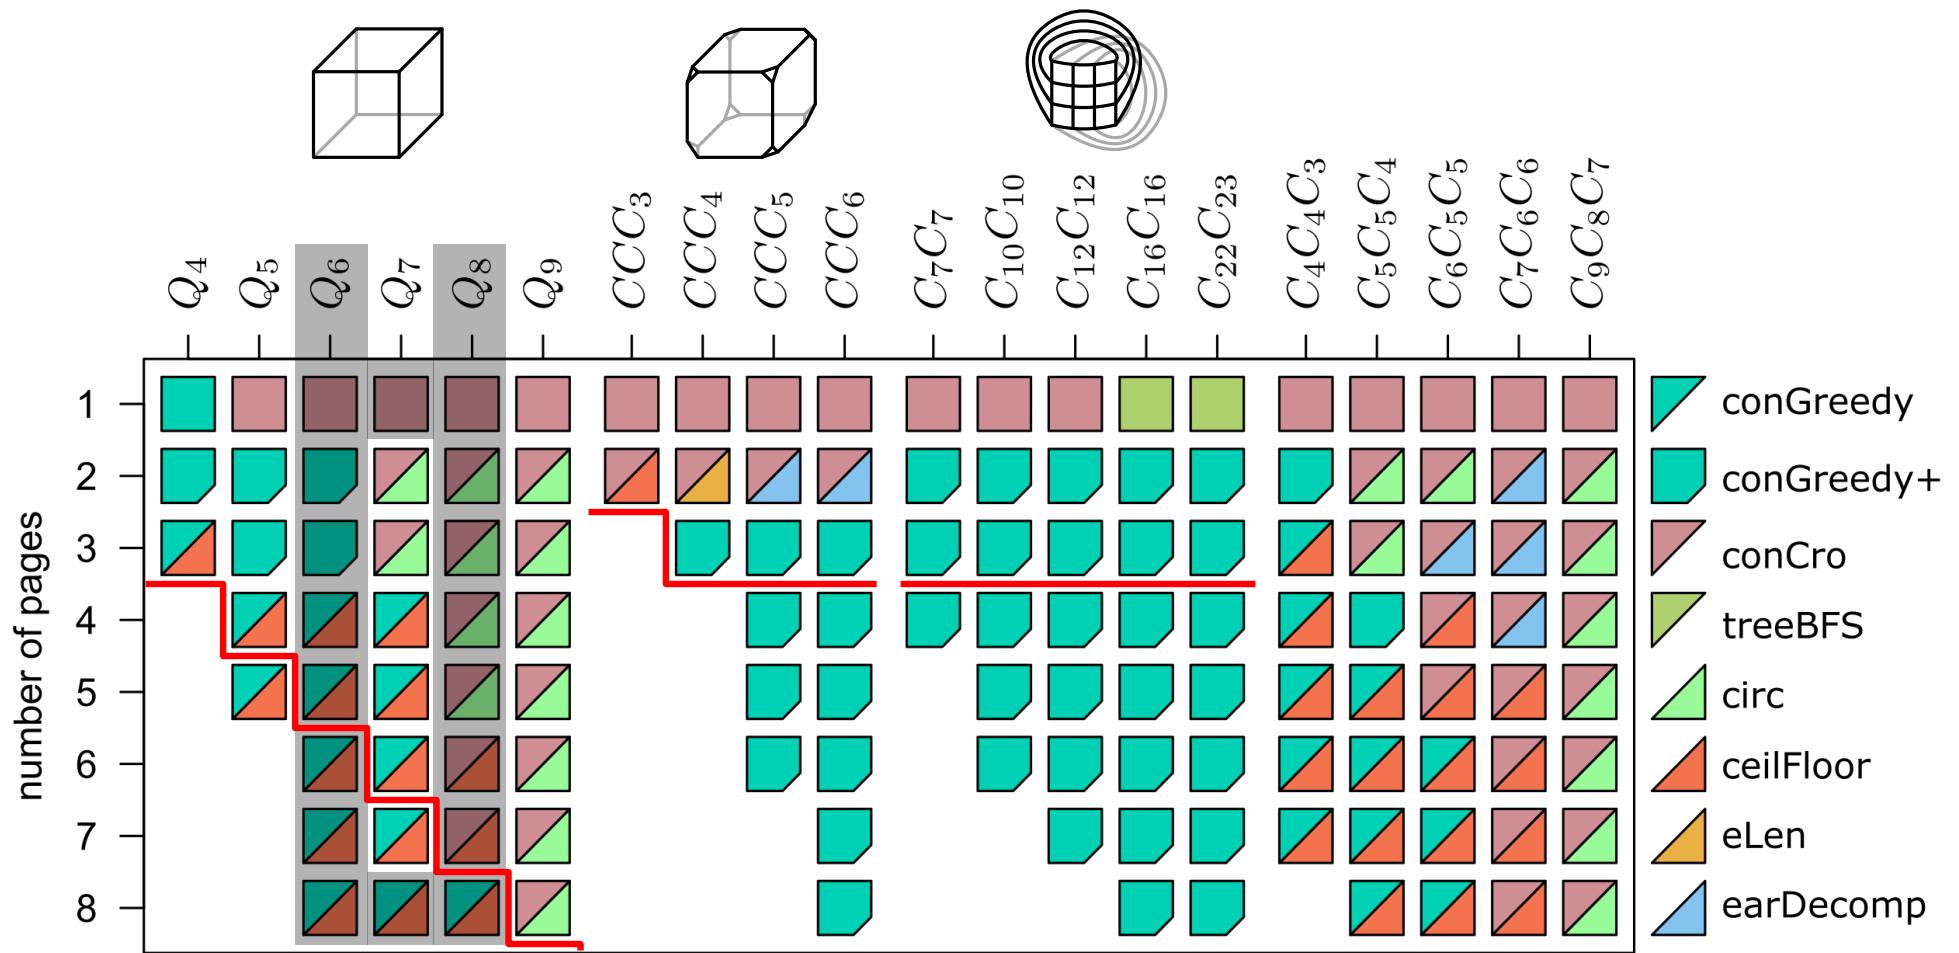

# Structured graphs - *k*-trees

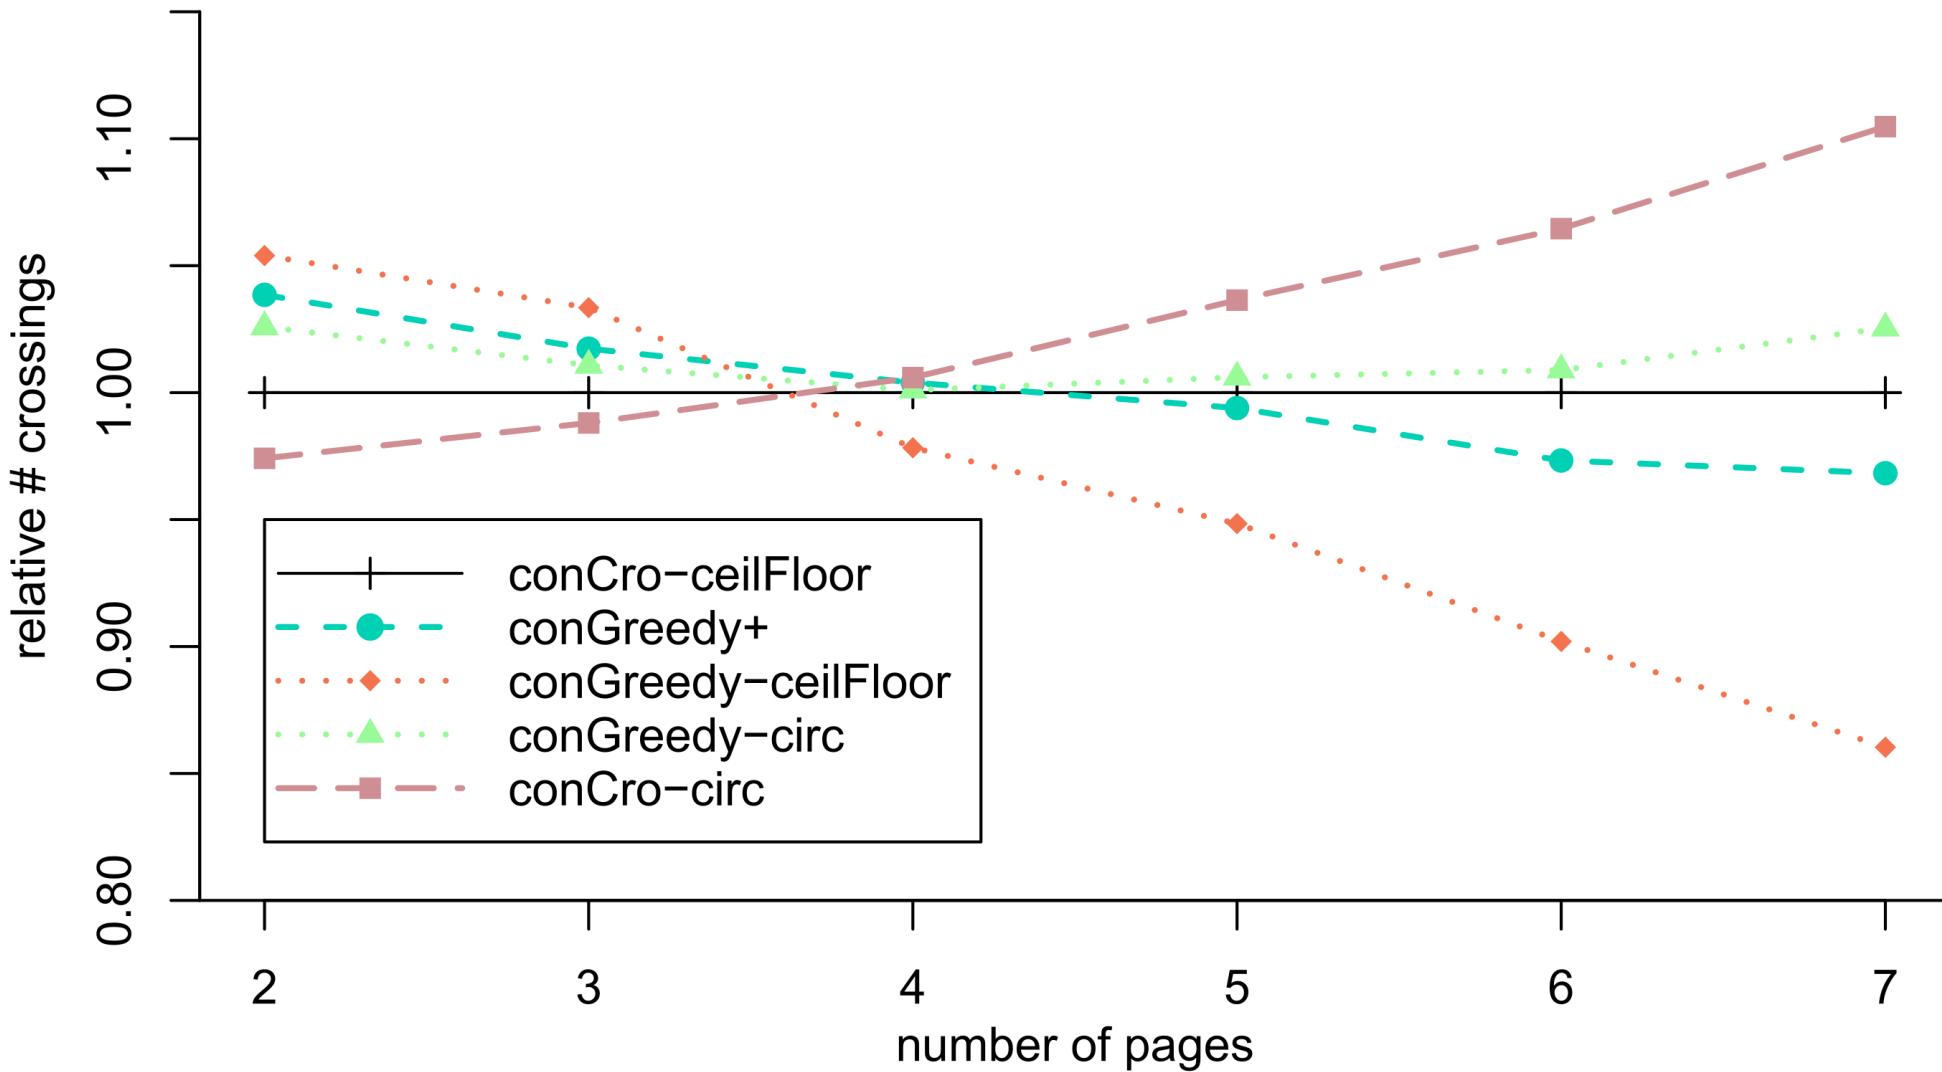

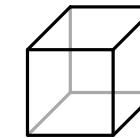

# Homogenous graphs

# Homogenous graphs

# Homogenous graphs - hypercube $Q_7$

# Summary

- Introduction of benchmark set
- Broad study of cases
  - Size, structurdeness and density of graphs matter
  - Number of pages matter
- Merging VO and PA problems
  - conGreedy+ performs well
  - greedy+ performs well
- Other new heuristics perform well in special cases
- slope best for high density
- Code for algorithms and graph generation on Github

# Thanks
